

CENTRIX
Connexio[®]

Self-Etch Bonding System

NEW 7th-Generation Bonding System

Connexio is a dual-cure, self-etching bonding system that creates a strong, resilient bond quickly and easily. Reinforced with nano-particles, Connexio is indicated for use with direct dual- or self-cure composite restorations and core buildups including fillings, inlays, onlays, crowns, bridges and posts.

Connexio is packaged with two parts: the self-etching dentin, enamel bonding agent and the dual-cure activator. It tolerates residual moisture and can be used with a variety of light-, self- and dual-curing composites.

Connexio firmly bonds tooth to composite or resin cements for permanent, tight margins. Fast-acting and easy to apply, Connexio reduces post-operative sensitivity – making it the perfect choice for both patient and doctor.

Connexio Features:

- Chemical-curing with additional activator for areas inaccessible with a light
- Adhesive core build-up
- Fixing of root pins/posts with dual-curing or self-curing composite cements
- Universal application
- Same adhesive properties as total-etch bonds

TEST RESULTS

Tensile dentin bond strength: 39.3 MPa

Shear enamel bond strength: 24.5 MPa

Marginal enamel seal: 97%

Marginal dentinal seal: 99%

Making Dentistry Easier.SM

5-Step Guide to Building a Void-free, Bonded, Composite Post & Core

- STEP 1** Prepare tooth. Remove excess moisture with a faint air jet. Do not over dry dentin.
-
- STEP 2** Mix 1 drop of Liquid 1 and 1 drop of Liquid 2 on a mixing palette with an application brush for approximately 2 sec (produces a self-etching adhesive). Connexio Self-Etch Bond is dual-curing and therefore must be applied immediately after mixing.
-
- STEP 3** Apply the adhesive in a layer of medium thickness to the enamel/dentin and rub into the tooth surface for 20 sec.
-
- STEP 4** Dry the adhesive layer for at least 5 sec with an air syringe.
-
- STEP 5** Polymerization – A. Direct restoration - Light-, self- and dual-curing materials. The bonding layer must be polymerized with blue light (halogen or LED lights) for 10 sec when using light-, self- and dual-curing restoratives. B. Indirect restoration - Light-curing luting composites: The bonding layer must be polymerized with blue light (halogen or LED lights) for 10 sec when using light-curing luting materials. Self- or dual-curing luting materials: When using dual- or self-curing luting materials, Connexio Self-Etch Bond also provides excellent adhesion without light-curing. Connexio Self-Etch Bond can also be light-cured for 10 sec with blue light (halogen or LED lights) as an optional step.
